Identifier	Topic	Reference to EIS/EA Report	Summary of Comment	Proponent's Response	Subsequent Comment
			<i>Date: March 2014</i>	<i>Date: June 2015</i>	
MNDM 2	Mine Closure and Rehabilitation		The proponent has taken what appears to be a mass loading approach to contaminant discharge and their conclusions regarding the low level of impact from the development appear to hinge largely on the effectiveness of the engineering controls on surface and subsurface drainage during operations and closure.	Thank you for your comment. Ongoing consultation with the MNDM will take place prior to the official submission of a Certified Closure Plan. Appropriate post closure planning for the management of surface and groundwater from the waste rock and tailings area will be included in the Certified Closure Plan as required.	<a href="#">MNDM 2B</a>
