<td>10.1.3, 10.3.1</td>
<td>EIS Table 8-8</td>
<td>The response discusses habitat compensation as a mitigation measure for bat species at risk only. In Table 8-8 there are no mitigation measures to address the displacement of larger wildlife species (e.g. moose, deer). The EIS indicates that larger animals will be displaced by the Project and that habitat losses are expected. Loss, disruption or a change in habitat suitability resulting in wildlife displacement and lost or restricted access to preferred areas for traditional Aboriginal practices (e.g. hunting, trapping, harvesting) should be described and appropriate mitigation measures and monitoring identified.</td>
<td>1. Describe the potential environmental effects of the Project on moose, taking into account the calving and herding sites. Provide a revised map (Figure 2-10) that identifies moose herding and calving sites in relation to the project footprint.</td>

Response:

1. The MNRF has not identified moose calving or herding sites in the LSA. The baseline noise conditions have been assumed to be 40 dBA during daytime hours and 35 dBA during nighttime hours (Atmospheric TSD, Section 4.2.1). During operations, noise greater than 35 dBA is expected to be constrained within approximately 3 km of the Project footprint (Atmospheric TSD, Figure 4-2). Sensory disturbance from noise may temporarily alter the abundance and distribution of moose near the Site. However, moose are anticipated to eventually habituate to the noise and level of disturbance of the Project, and effects on the moose population are anticipated to be negligible (Terrestrial Ecology TSD, Section 3.5.1).

2. Mitigation to limit potential Project effects on larger wildlife species such as moose and deer includes the following:
   - Completing Project works and activities in accordance with the Fish and Wildlife Conservation Act (1997) to limit intentional mortality and harassment of wildlife;
   - Providing awareness training to all staff, visitors, and contractors;
   - Implementing and enforcing speed limits on the Site;
   - Requiring wildlife to have the right-of-way; and
   - Communication of sightings of wildlife, especially on or near roads.

Reporting of all wildlife mortalities will be required by site personnel. Staff will be educated on the importance to report all wildlife incidents, which includes mortality, during new employee orientations, and will be reminded through on-going environmental awareness training on site.
